Final Answers
MATH105 April 2011

April 4, 2015

How to use this resource

- When you feel reasonably confident, simulate a full exam and grade your solutions. For your grading you can get the full solutions here.
- If you're not quite ready to simulate a full exam, we suggest you thoroughly and slowly work through each problem. Use this document with the final answers only to check if your answer is correct, without spoiling the full solution.
- Should you need more help, check out the hints and video lecture on the Math Education Resources.

Tips for Using Previous Exams to Study: Work through problems

Resist the temptation to read any of the final answers below before completing each question by yourself first! We recommend you follow the guide below.

1. **How to use the final answer:** *The final answer is not a substitution for the full solution!* The final answer alone will not give you full marks. The final answer is provided so that you can check the correctness of your work without spoiling the full solution.
   - To answer each question, only use what you could also use in the exam. Download the raw exam here.
   - If you found an answer, how could you verify that it is correct from your work only? E.g. check if the units make sense, etc. Only then compare with our result.
   - If your answer is correct: good job! Move on to the next question.
   - Otherwise, go back to your work and check it for improvements. Is there another approach you could try? If you still can't get to the right answer, you can check the full solution on the Math Education Resources.
2. **Reflect on your work:** Generally, reflect on how you solved the problem. Don't just focus on the final answer, but whether your mental process was correct. If you were stuck at any point, what helped you to go forward? What made you confident that your answer was correct? What can you take away from this so that, next time, you can complete a similar question without any help?
3. **Plan further studying:** Once you feel confident enough with a particular topic, move on to topics that need more work. Focus on questions that you find challenging, not on those that are easy for you. Once you are ready to tackle a full exam, follow the advice for the full exam (click here).

Please note that all final answers were extracted automatically from the full solution. It is possible that the final answer shown here is not complete, or it may be missing entirely. In such a case, please notify `mer-wiki@math.ubc.ca`. Your feedback helps us improve.

This pdf was created for your convenience when you study Math and prepare for your final exams. All the content here, and much more, is freely available on the Math Education Resources.

Question 1 (a)

FINAL ANSWER. where we used $e^u = x$.

Question 1 (b)

FINAL ANSWER. $\int_0^{\pi/2} \cos^3(x) \sin^2(x)\, dx = \frac{2}{15}$.

Question 2

FINAL ANSWER. $A = \ln 2$.

Question 3

FINAL ANSWER. Thus no such k exist!

Question 4

FINAL ANSWER. *The consumer surplus is approximately \$2.05*

Question 5 (a)

FINAL ANSWER. We also know that $A(0) = P$ because P is the initial deposit.

Question 5 (b)

FINAL ANSWER. $A(t) = 100e^{0.005 \cdot t^2}$

Question 5 (c)

FINAL ANSWER. We arrive at $t = 20$ years.

Question 6

FINAL ANSWER. We have $P'(x) = -1/100 \cdot x + 3$ and this equals to zero only for $x = 300$. Since $y = 1000 - x$ we must have $y = 700$.**Important Remark.** If the question does not clearly mention a specific method you have to apply to solve the problem, it is your choice which method you use.Some students find the Lagrange Multiplier solution simpler, some not.Decide based on your strengths!

Question 7

FINAL ANSWER. Because one eigenvalue is positive and one eigenvalue is negative, we conclude that the Hessian matrix is indefinite, and thus the point $(1, 3)$ is a saddle point.

Question 8 (a)

FINAL ANSWER. $\frac{\partial f}{\partial y}(81, 16) = 135$ So the marginal productivity of labour is 80 (dollars of productivity per

dollar of labour investment) and the marginal productivity of capital is 135 (dollars of productivity per dollar of capital investment).

Question 8 (b)

Final answer. $f_y(81,16)(y-y_0) = 45$ dollars.So based on these approximations, the second policy should yield a higher productivity.

Question 8 (c)

Final answer. $(-135, 80)$ and $(135, -80)$

Question 9 (a)

Final answer. $\lim_{(x,y)\to(0,0)} f(x,y) = \frac{1}{2} \neq 0$. So, depending on the path taken to the origin, we get a different value for the above limit.Therefore, the limit does not exist.

Question 9 (b)

Final answer. $f'(0) = 2$ So the slope of the curve $y = f(x)$ at $x = 0$ is 2.

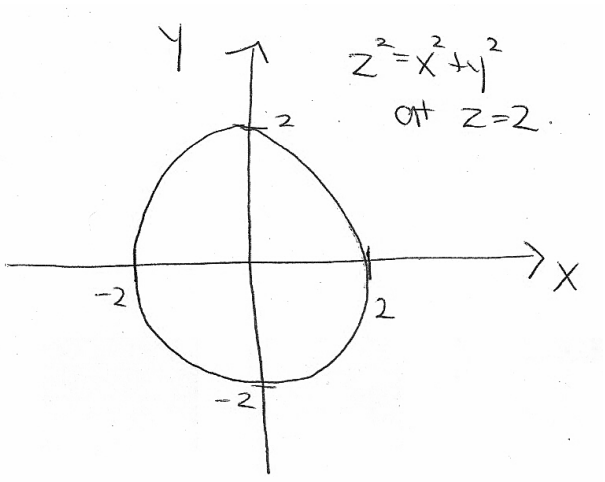
Question 9 (c)

Final answer. $\lim_{n\to\infty} \frac{1}{n} \sum_{k=1}^{n} \ln\left(1 + \frac{k}{n}\right) = \int_0^1 \ln(1+x)\,dx$

Question 9 (d)

Final answer. $\lim_{b\to 1^-} \int_0^b \frac{2x}{1-x^2}\,dx = \lim_{b\to 1^-} -\ln(1-b^2) + \ln(1)$ and this last limit evaluates to negative infinity.Hence, the integral diverges.

Question 9 (e)



Final answer.

Question 9 (f)

FINAL ANSWER. $(p - 1/2)^2 = 0$ Thus, the value of p such that Var(X) $= 1/4$ is $p = 1/2$.

Question 9 (g)

FINAL ANSWER. Notice that the provided information for $f(1, 0) = 0$ was unnecessary.
